12C seismic observations:

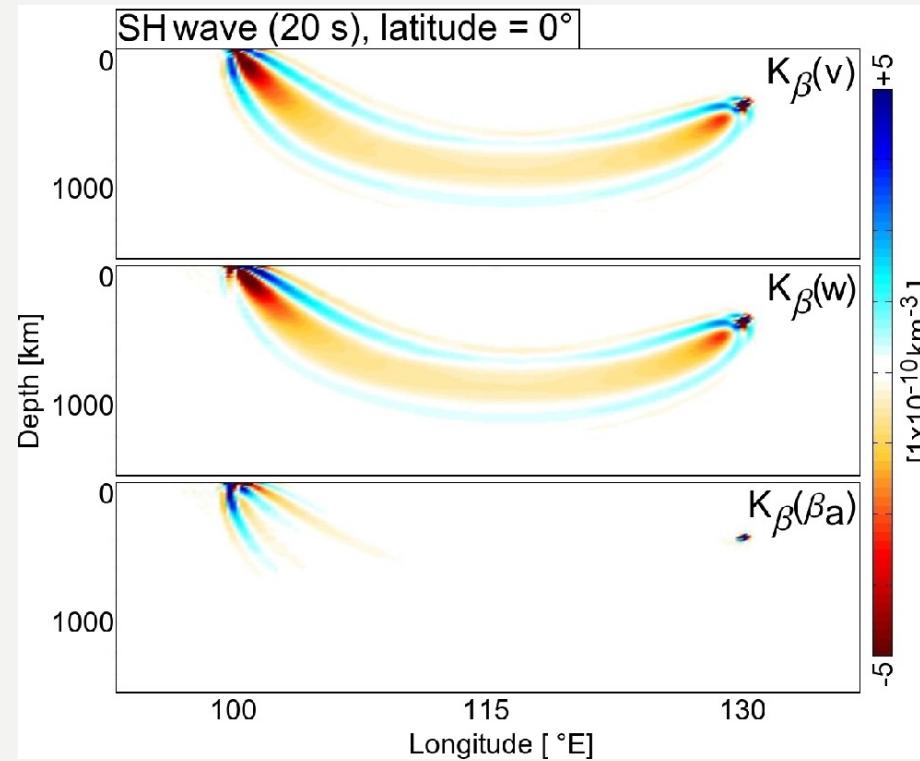

Which subsets of the complete set of observables optimise the sensitivity to certain structural parameters?

Which subsets of the complete set of observables optimise the sensitivity to certain structural parameters?

I. Physical intuition

Which subsets of the complete set of observables optimise the sensitivity to certain structural parameters?

II. Mathematical derivation

Sensitivity power:

$$\mathfrak{S}_j(\mathbf{w}) := \int \left[\sum_{i=1}^{12} w_i K_{i,j}(\mathbf{x}) \right]^2 d^3\mathbf{x} \quad , \text{with} \quad \sum_{i=1}^{12} w_i^2 = 1$$

Optimisation:

$$\hat{\mathfrak{S}} := \mathfrak{S}_1 - \sum_{j \neq 1} \mathfrak{S}_j$$

Lagrange function:

$$\mathfrak{L}(\mathbf{w}, \lambda) := \hat{\mathfrak{S}}(\mathbf{w}) + \lambda \left(\sum_{i=1}^{12} w_i^2 - 1 \right)$$
